Slope-Intercept Formula . . . . .	3

## Course Information

Data Science Math Skills by **Duke University** is a online course you can take on this site Coursera.

## Motivation for Learning & Re-learning

A lot of graduate school students struggle with Data Science courses only because of their lack of knowledge and/or understanding of Mathematics for Data Science. The course gives an overview of Mathematical concepts you will encounter while learning Data Science.

## Supplemental Notes and Videos

Here's how I make my notes:

My notes include videos from Khan Academy. The content's the same and often a bit better due to lack of errors. The text are usually from the Coursera video transcripts.

I indicate **why** it is important to learn such concepts through **Further Reading** notes.

## Sets and What They're Good For

### Set Basics and Vocabulary

- Set Theory
- Set Theory Operations

### Further Reading

A set is the fundamental discrete structure on which all other discrete structures are built.

Those who studied Discrete Mathematics or read a book about it will probably just re-learn a lot from this course on Set Basics.

- Applications of Set Theory in Computer Science
- Discrete Mathematics and Its Applications

## Descartes Was Really Smart

### Plotting Points

- The x-axis is going to be the set of all points x-y in the Cartesian plane, x-y in  $\mathbb{R}^2$ , such that their y coordinate is zero.
- We divide the Cartesian plane into four separate regions, and these we call **quadrants**.
- Coordinate plane: quadrants

### Distance Formula

- Distance formula

$$d = \sqrt{(x_2 - x_1)^2 + (y_2 - y_1)^2}$$

### **Point-Slope Formula for Lines**

- Point Slope Form

$$y - b = m(x - a)$$

### **Slope-Intercept Formula**

- Slope Intercept Equation
- Intro to Slope Intercept Form

$$y = mx + b$$
